

# GOES-R Aviation Weather Applications

Frederick R. Mosher  
NWS/NCEP  
Aviation Weather Center

# Aviation is Weather Sensitive

- Thunderstorms
- Turbulence
- Aircraft Icing
- Volcanic Ash
- Head/Tail Winds
- Clouds/Restricted Visibility

# New Technologies for Aviation Weather

- Weather in the cockpit displays.
- New remote sensing tools.
- Improved weather forecast models and aviation forecast algorithms.

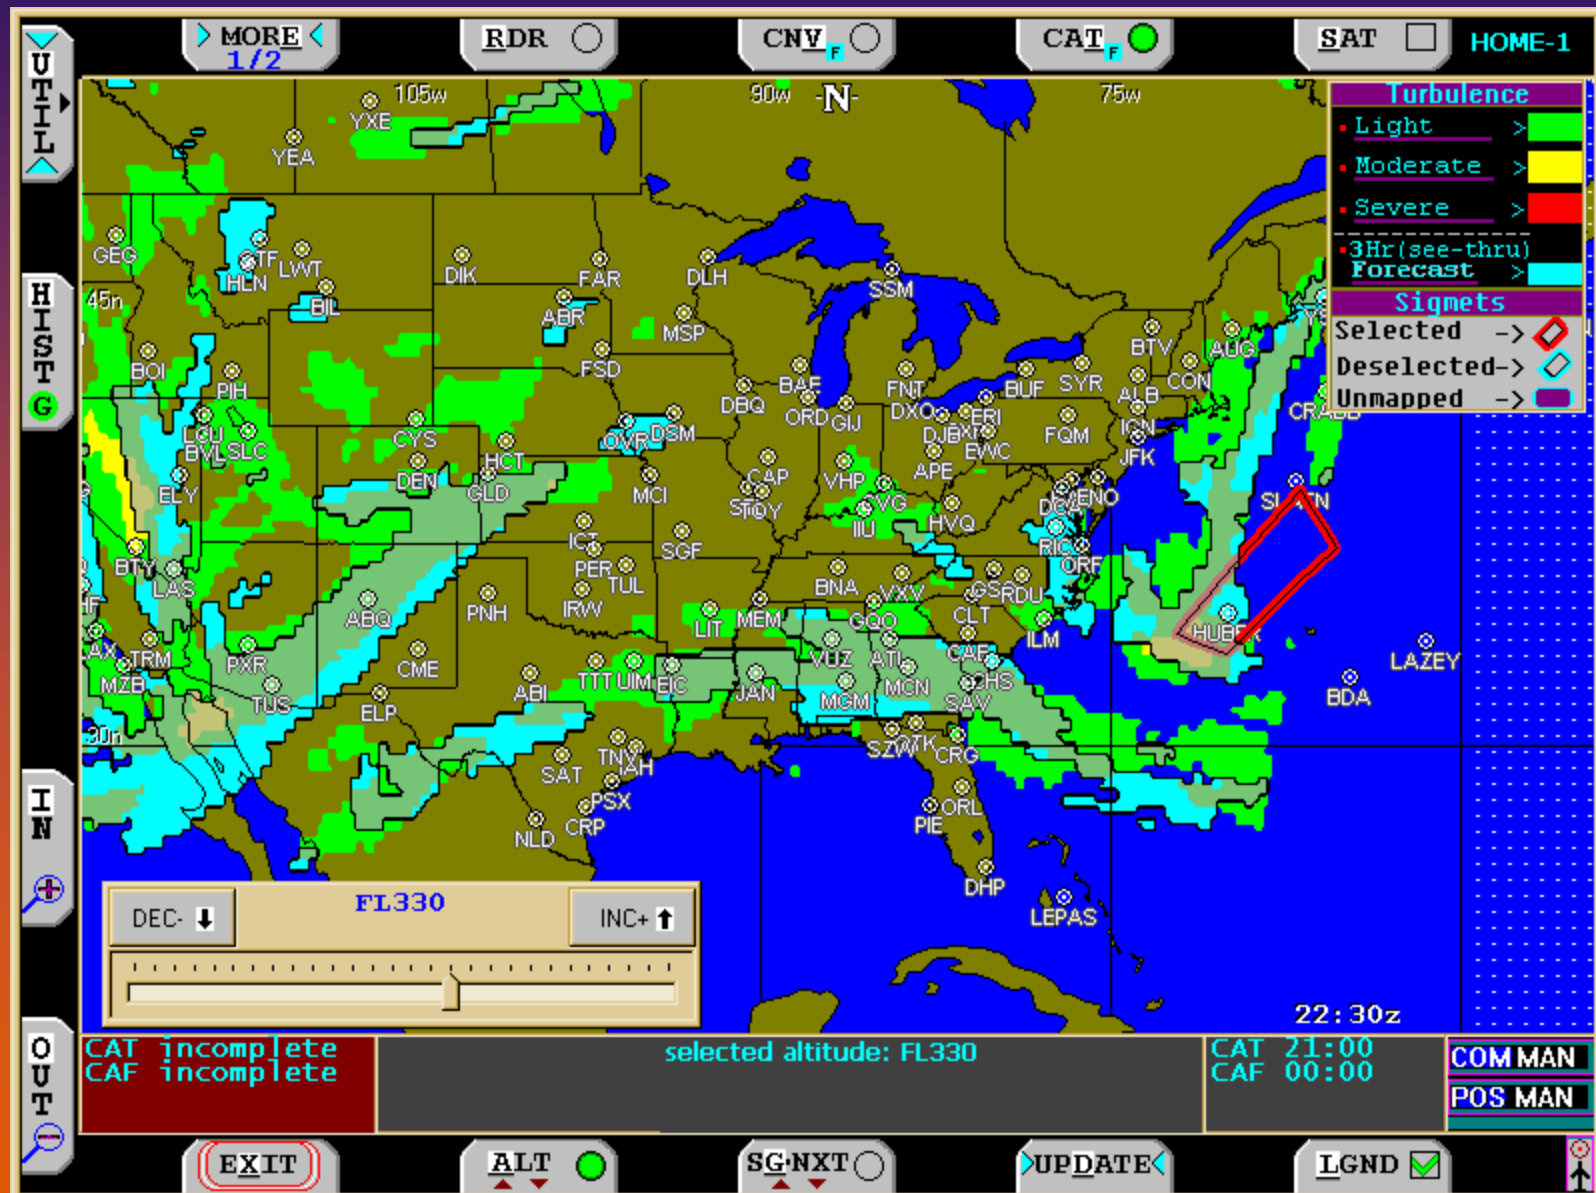

# Weather in the Cockpit

- 240x320 resolution video monitor in instrument panel of aircraft.
- 30Kbs communications link to aircraft.
- Commercial services for displays of aviation specific data.
- Available for commercial and general aviation aircraft both within US and globally.

Actual GOES

# Current Land Based Lightning Detection

# Continuous total lightning from GEO will identify intensifying storms and severe storm potential

Process physics understood

Storm-scale model for decision support system

**Demonstrated in  
LEO with  
OTD & LIS**

Ice flux drives lightning

Physical basis for improved forecasts

Lightning jump precedes severe weather

Lightning improves storm predictability

# New Turbulence Tools

- Aircraft turbulence is caused by up and down eddies.
- Higher resolution Water Vapor channels will be able to see these eddies.
- New high resolution sounders (GIFTS) will be able to resolve some of these eddies in the vertical.

# Mountain Waves in WV channel (6.7 $\mu\text{m}$ )

## 7 April 2000, 1815 UTC

Simulated ABI

Actual GOES-8

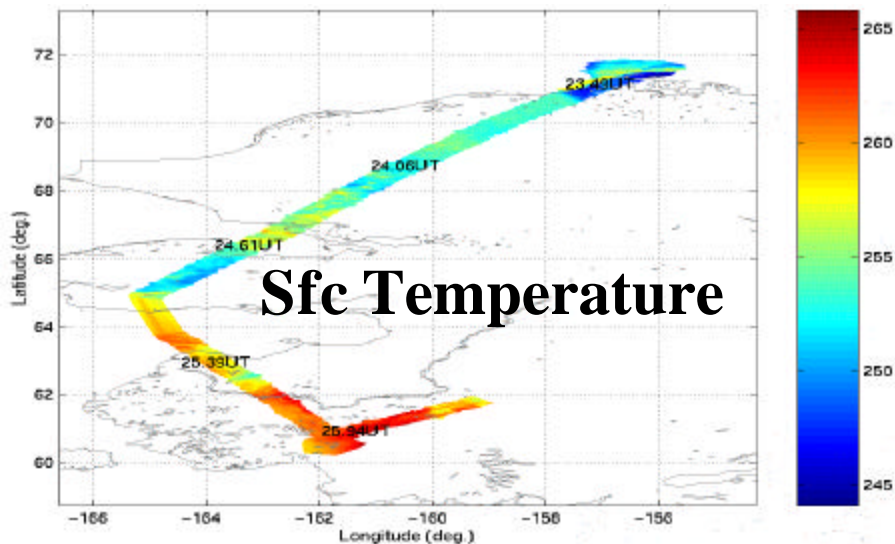

Mountain waves over Colorado and New Mexico were induced by strong northwesterly flow associated with a pair of upper-tropospheric jet streaks moving across the elevated terrain of the southern and central Rocky Mountains. The mountain waves appear more well-defined over Colorado; in fact, several aircraft reported moderate to severe turbulence over that region.

Both images are shown in GOES projection.

# Arctic (March 20-21, 2001)

No Turbulence Signatures at 500 mb

# Aircraft Icing

- Aircraft flying through super cooled liquid water droplets which stick to wings causing loss of lift and increased drag.
- Satellites will be able to detect super cooled liquid water at cloud tops.

# ABI Simulations: Water/Ice Clouds and Snow/Lake Ice

## Water/Ice Clouds and Snow/Lake Ice

### 3-color composite (Visible/1.6 $\mu\text{m}$ /8.5-11 $\mu\text{m}$ )

February 12, 2001 16:27 UTC

# Volcanic Ash

- Multi Channel differences can differentiate between volcanic ash and weather clouds.
- 12 micron channel detects silicates
- 3.7 micron channel detects large particle size
- 8.6 micron channel detects the SO<sub>2</sub>.

# Multi-channel Volcanic Ash Detection

MODIS R: (CH32-CH29)+(CH32-CH31) G: CH6 B: CH1  
**MODIS Multi-spectral Composite for Cleveland Eruption**

19 February 2001, 2310 UTC

J-S. Im / G. Ellrod

# Winds

- Head/tail winds have a major impact on aircraft fuel consumption.
- Cloud winds measured where there are clouds.
- Water vapor winds fill in around clouds.
- Multiple water vapor channels will allow for different heights of wind measurements.

# Water Vapor Winds

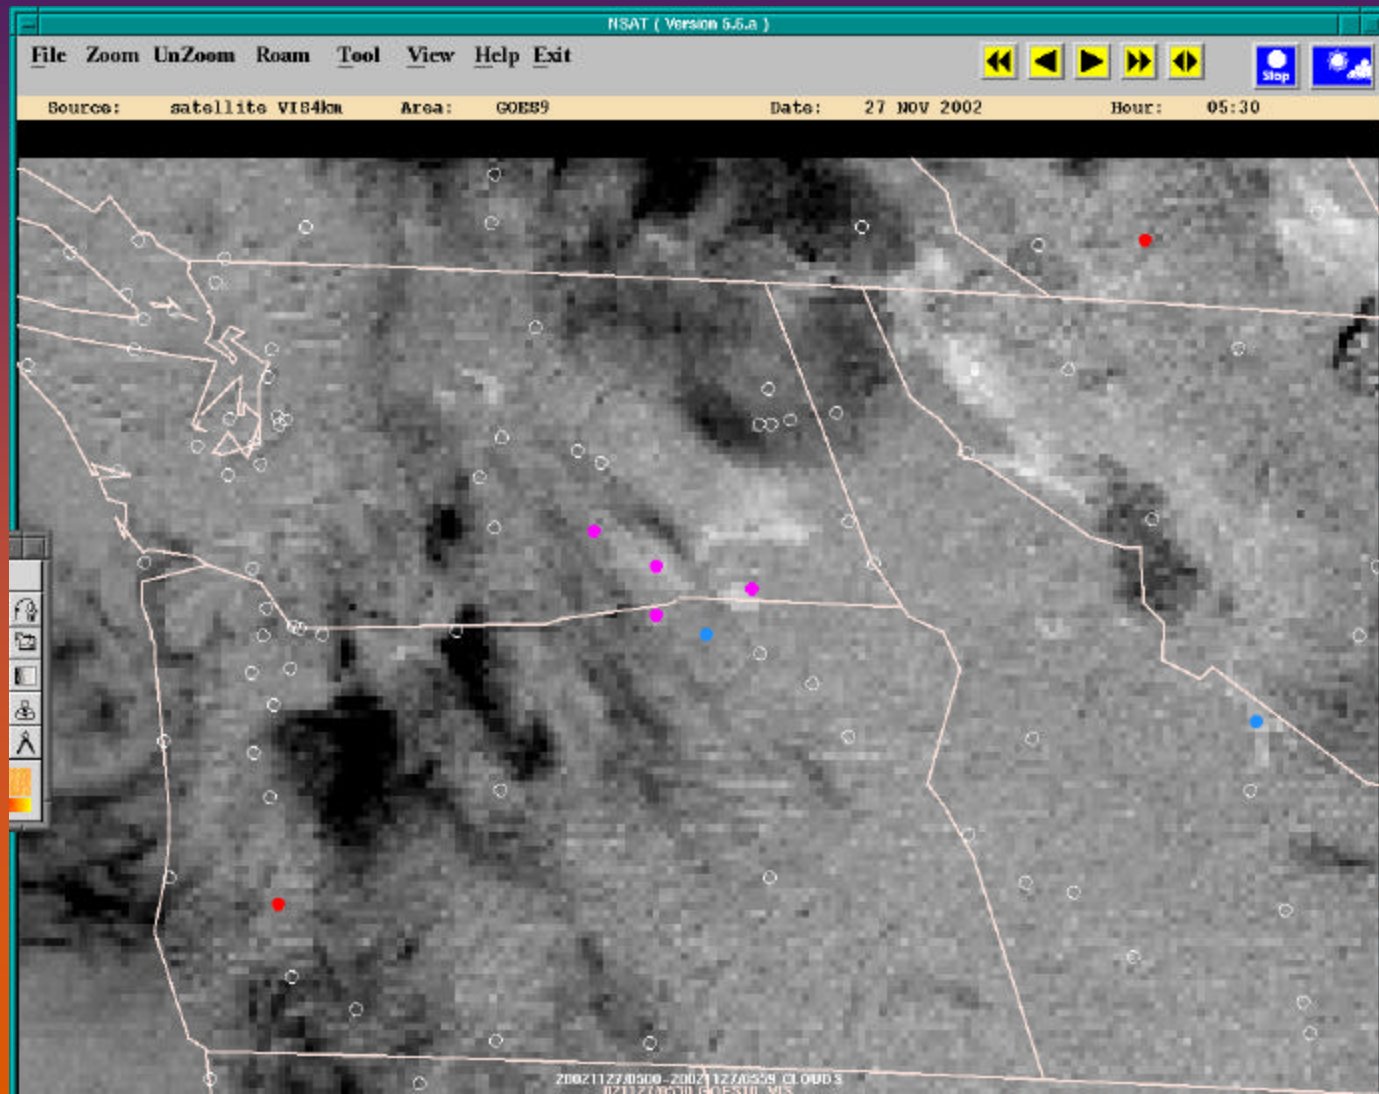

# Restricted Visibility

- Two classes of pilot's license – Visible Flight Rules (VFR) and Instrument Flight Rules (IFR). Most general aviation pilots are VFR pilots. They must be able to see the ground to fly.
- Fog detection with 3.7 micron channel at night.
- Haze detection with blue and red channels.

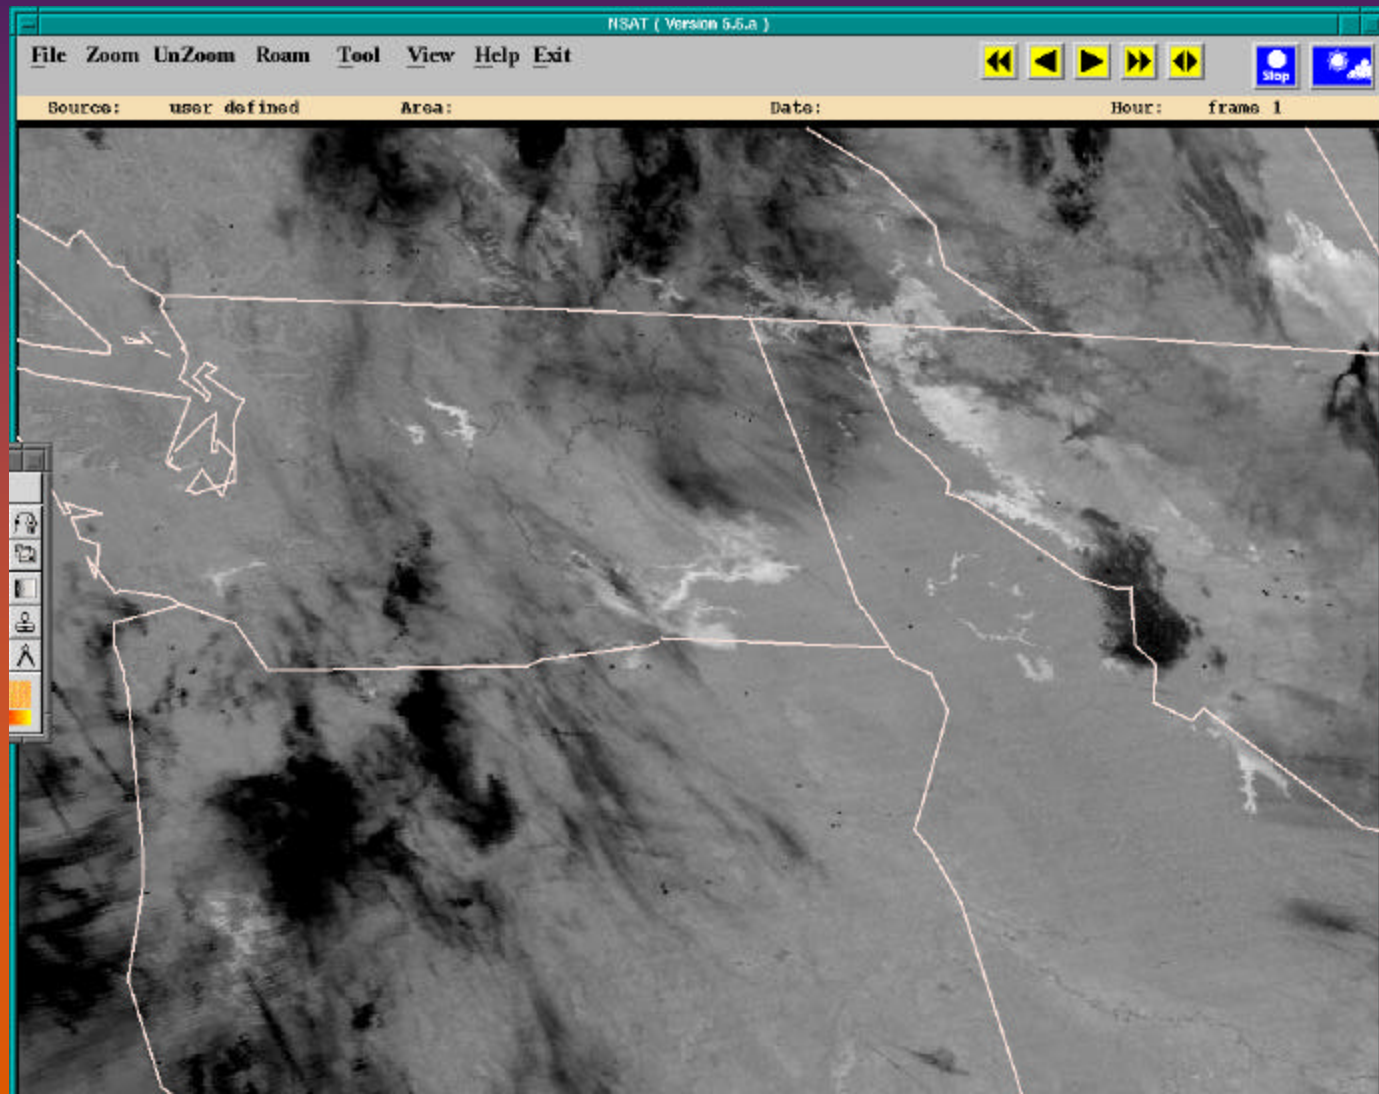

# GOES-10 Fog Detection at Night

# GOES-R Fog Detection at Night

# Haze Detection

UTC Bands 010403: Eastern US

SSEC UW-MADISON DIRECT BROADCAST

# Cloud Heights

- ASOS cloud heights above 12,000 feet are currently determined from GOES data.
- New GOES-R will significantly improve cloud height determination.

# ABS/HES Cloud Top Pressure Retrieval Performance

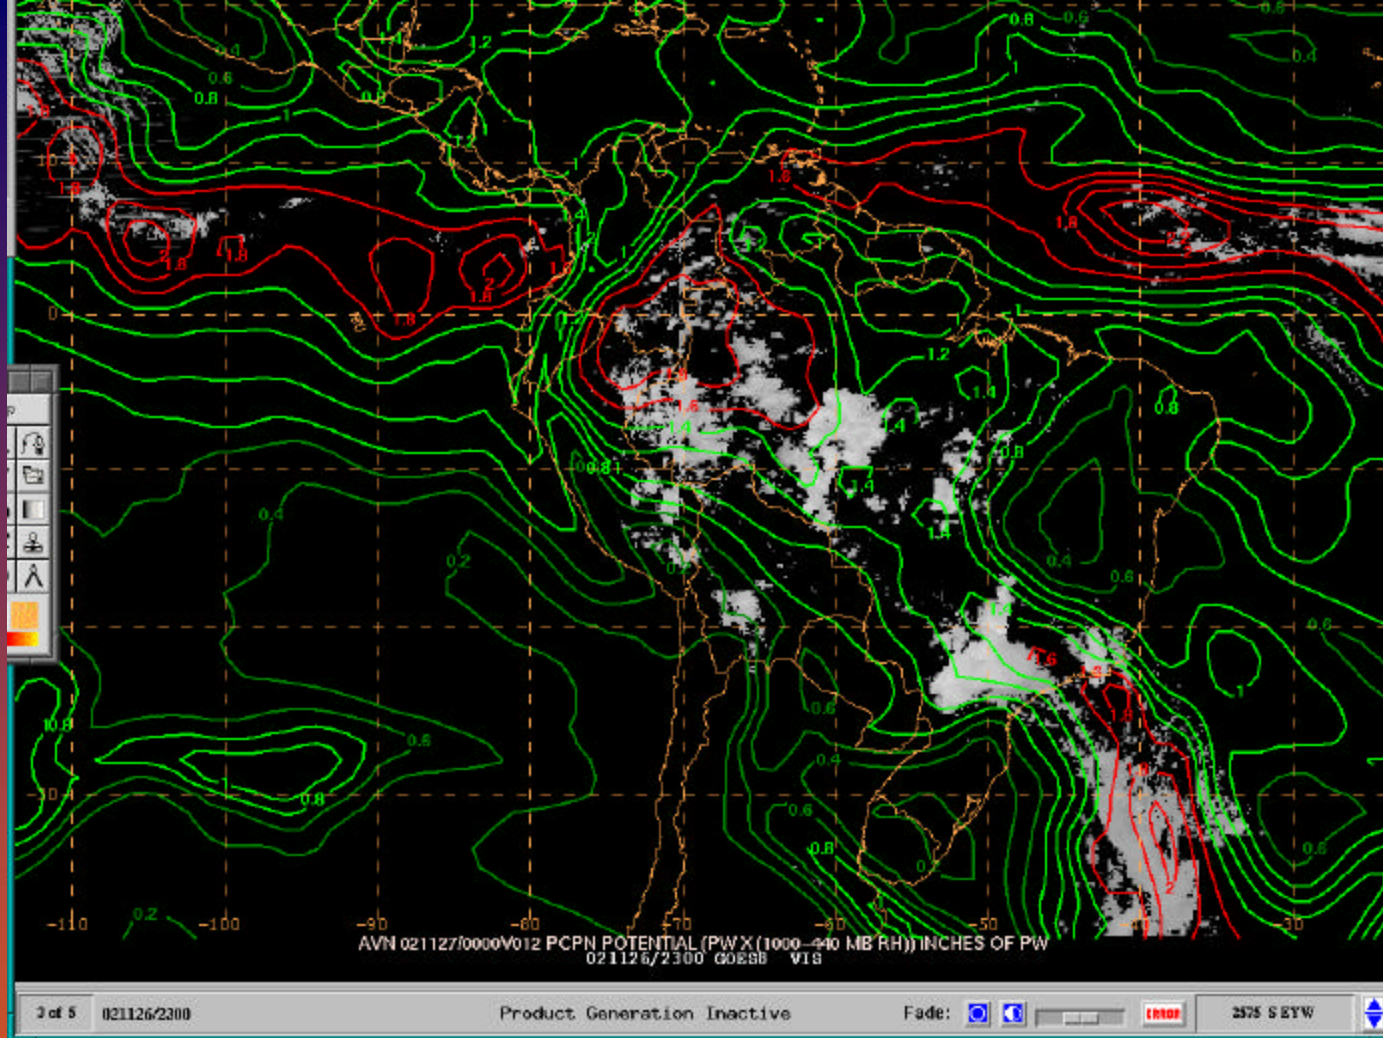

Future GOES -- simulating  
the Advanced Baseline  
Sounder (ABS) performance.  
Better cloud-top pressure  
retrievals.

# Numerical Models

- Higher resolution. Better physics.
- Big advances in data assimilation.
- Models are starting to effectively use satellite information.
- Assimilation techniques can utilize radiances (temperature and moisture), cloud tops, initial convection, winds, fog, etc.

GFS Precipitation Potential overlaid  
on Observed GCD Convection

# Summary

- Satellite information is becoming more important for safe, efficient aviation operations.
- Weather forecasts are improving.
- Technologies for delivery of weather information directly to the pilots are becoming available.
